Expanded Access to Convalescent Plasma for the Treatment of Patients with COVID-19

Unique Protocol Identification Number: 20-003312
National Clinical Trial (NCT) Identified Number: 04338360
Principal Investigator: Michael Joyner, MD
IND 19832 Sponsor: Michael Joyner, MD
Funded by: BARDA
Version 8.0
16 June 2020

The Mayo Clinic IRB will serve as the IRB of record for all sites participating in this protocol. In accordance with 45 CFR 46.103(e), agreeing to participate in the trial via sign up on [www.uscovidplasma.org](http://www.uscovidplasma.org) will serve as documentation of each participating institution’s reliance on Mayo’s IRB. A separate IRB reliance agreement is not required.

Statement of Compliance

The Expanded Access protocol will be carried out in accordance with applicable federal regulations:

Treating Physician Responsibilities

The Sponsor may contact the treating physician as appropriate for completion of all data forms in a timely manner. You agree to respond to the sponsor in a timely manner with complete information. Failure to comply will be in violation with the protocol.
1 PROTOCOL SUMMARY

1.1 SYNOPSIS

Title: Expanded Access to Convalescent Plasma for the Treatment of Patients with COVID-19

Study Description: This expanded access program will provide access to investigational convalescent plasma for patients in acute care facilities infected with SARS-CoV-2 who have severe or life-threatening COVID-19, or who are judged by a healthcare provider to be at high risk of progression to severe or life-threatening disease. Following registration on the protocol and provision of informed consent, patients will be transfused with one (or more) units of convalescent plasma obtained from an individual who has recovered from documented infection with SARS-CoV-2. Safety information collected will include serious adverse events. Other information to be collected retrospectively will include patient demographics, acute care facility resource utilization (total length of stay, days in ICU, days intubated, and survival to discharge from an acute care facility.

Objectives: Primary Objective: Provide access to COVID-19 convalescent plasma
Secondary Objectives: Safety

Endpoints: Primary Endpoint: Availability of convalescent plasma
Secondary Endpoints: Serious adverse events

Study Population: Patients with severe or life-threatening manifestations of COVID-19, or documented to be at high risk of developing such manifestations

Phase: Expanded Access Program

Description of Sites/Facilities Enrolling Participants: Acute care facilities treating patients with COVID-19

Description of Study Intervention: Administration of convalescent plasma obtained from donors with prior documented SARS-CoV-2 infection

Study Duration: 12 months

Participant Duration: Patients will complete the study when they are discharged from the acute care facility in which they received the COVID-19 convalescent plasma.
1.2 SCHEMA

Study Schema

☐ Eligibility Criteria Met

Inclusion Criteria

1. At least 18 years of age (if less than 18 years contact FDA for emergency IND authorization)
2. Laboratory confirmed diagnosis of infection with SARS-CoV-2
3. Admitted to an acute care facility for the treatment of COVID-19 complications
4. Severe or life threatening COVID-19, or judged by the treating provider to be at high risk of progression to severe or life-threatening disease
5. Informed consent provided by the patient or healthcare proxy

Severe disease defined as any of the following:
- dyspnea
- respiratory frequency > 30/min
- blood oxygen saturation ≤ 93%
- partial pressure of arterial oxygen to fraction of inspired oxygen ratio < 300
- lung infiltrates > 50% within 24 to 48 hours

Life-threatening disease defined as any of the following:
- respiratory failure
- septic shock
- multiple organ dysfunction or failure

☐ Informed consent obtained from patient or healthcare proxy

☐ Blood type obtained at local laboratory per local institutional procedures and policies

Patient Registered with American Red Cross or other blood source by uscovidplasma.org.

☐ Transfusion with appropriate COVID-19 convalescent plasma per institutional transfusion protocol

Patients may be premedicated with acetaminophen and diphenhydramine, per local practice

Recommended administration rate for plasma administration should follow best clinical practice procedures for the patient’s unique condition and your facility guidelines.

☐ Serious adverse events observed by the treating physician or reported by patient to provider

☐ Reporting of patient demographics and acute care resource utilization

Information entered on COVID-19 Plasma Expanded Access Program secure website

(Information on plasma unit administered will be obtained directly from blood collector)
2 INTRODUCTION

2.1 STUDY RATIONALE

Convalescent plasma has appeared to be of benefit for the treatment of certain infectious diseases, including infections from respiratory viruses. Preliminary evidence indicates that convalescent plasma may possibly be of benefit for some patients with COVID-19, leading to improvement.

2.2 BACKGROUND

One of the ways that people fight of infectious diseases is by developing antibodies that lead to the destruction of the invading microorganism. The antibodies are present in the blood, and more specifically in the liquid portion of the blood called plasma. People who have recovered from being recently infected can donate plasma and that plasma can then be given to individuals who are ill with the virus in order to try to help eliminate it from the system and allow them to get better. This has worked in previous outbreaks of respiratory diseases like influenza, and there are some early data to suggest that it might work for some people with COVID-19.\textsuperscript{1,2}

2.3 RISK/BENEFIT ASSESSMENT

2.3.1 KNOWN POTENTIAL RISKS
Plasma represents a licensed blood product, for which the risks are well described. These are the risks associated with the administration of plasma, including allergic reaction and viral infections. There is also the risk that convalescent plasma may be ineffective.

2.3.2 KNOWN POTENTIAL BENEFITS
COVID-19 convalescent plasma has not yet been demonstrated to provide clinical benefit in patients affected by this disease.

2.3.3 ASSESSMENT OF POTENTIAL RISKS AND BENEFITS
The safety profile of plasma administration is well established. Taking into account the preliminary data available on the possible benefit of COVID-19 plasma along with the relative lack of other readily available therapeutic options for severe or life-threatening disease, providing patients access to compatible COVID-19 plasma as part of this expanded access protocol appears to reasonably balance potential risks with possible benefit that may outweigh such risks.

4 STUDY DESIGN

4.1 OVERALL DESIGN

This is an open-label expanded access program to make appropriately matched convalescent plasma available for the treatment of patients in acute care facilities infected with SARS-CoV-2 who have severe or life-threatening COVID-19, or who are judged by a healthcare provider to be at high risk of progression to severe or life-threatening disease. COVID-19 convalescent plasma will be obtained from blood suppliers and will meet all regulatory requirements for conventional plasma and FDA’s additional considerations for COVID-19 convalescent plasma (https://www.fda.gov/vaccines-blood-biologics/investigational-new-drug-ind-or-device-exemption-ide-process-cber/investigational-covid-19-convalescent-plasma-emergency-inds). Information collected following plasma administration will include serious adverse events, as well as patient demographics, acute care resource utilization, and characteristics of the convalescent plasma administered. Due to the nature of the COVID-19 outbreak, data on patient demographics, acute care resource utilization, and characteristics of the convalescent plasma administered may be collected retrospectively.

4.2 SCIENTIFIC RATIONALE FOR STUDY DESIGN

Convalescent plasma collected from individuals who have recovered from a prior viral infection for the passive transfer of antibodies has been used at various times over the past century. There has been some evidence for benefit against hepatitis B, polio, measles, influenza, Ebola and other pathogens. Results from small case series during the prior MERS and SARS coronavirus outbreaks documented safety and faster viral clearance following convalescent plasma administration, particularly when given early in the disease course. Additionally, there is preliminary clinical evidence that suggests that convalescent plasma might provide benefit to individuals with SARS-CoV-2 infection and manifestations of COVID-19. At this time there are few therapeutic options for the treatment of COVID-19 and no prophylactic vaccine is currently available. Based on the preliminary evidence of possible efficacy, this protocol is making convalescent plasma available to individuals with documented SARS-CoV-2 disease at acute care facilities who have severe or life-threatening COVID-19, or who are judged by a provider to be at high risk of progression to severe or life-threatening disease.
4.3 JUSTIFICATION FOR DOSE

Initial data available from studies using COVID-19 convalescent plasma for the treatment of individuals with severe or life-threatening disease indicate that a single dose of 200 mL showed potential efficacy. The volume of plasma to be transfused should be based upon the patient’s weight and clinical comorbidities (e.g. patients with impaired cardiac function and heart failure may require less volume or more prolonged transfusion times). The volume of plasma to be transfused should be at least one unit (approximately 200 mL) but may be greater if the treating clinician concludes a larger volume is appropriate. Transfusions may occur at any time throughout the hospitalization including multiple doses on non-sequential days. In general, it is expected that most patients will receive two units or less, but this language is not intended to restrict the use of convalescent plasma in larger quantities when the treating physician determines that such volumes and/or re-treatment are clinically justified.

4.4 CONVALESCENT PLASMA COMPATIBILITY

ABO compatible convalescent plasma will be transfused preferentially. If ABO compatible convalescent plasma is not available, investigators may follow their institution’s guidelines for administration of incompatible plasma with respect to ABO mismatch, titer, and volume limits.

4.5 END OF STUDY DEFINITION

Patients will complete the study when they are discharged from the acute care facility in which they received the COVID-19 convalescent plasma or 30 days after most recent convalescent plasma transfusion whichever comes first.
5 STUDY POPULATION

5.1 INCLUSION CRITERIA

1. Age at least 18 years
2. Laboratory confirmed diagnosis of infection with SARS-CoV-2
3. Admitted to an acute care facility for the treatment of COVID-19 complications
4. Severe or life threatening COVID-19, or judged by the treating provider to be at high risk of progression to severe or life-threatening disease
5. Informed consent provided by the patient or healthcare proxy

Severe COVID-19 is defined by one or more of the following:

- dyspnea
- respiratory frequency ≥ 30/min
- blood oxygen saturation ≤ 93%
- partial pressure of arterial oxygen to fraction of inspired oxygen ratio < 300
- lung infiltrates > 50% within 24 to 48 hours

Life-threatening COVID-19 is defined as one or more of the following:

- respiratory failure
- septic shock
- multiple organ dysfunction or failure

5.2 STRATEGIES FOR RECRUITMENT AND RETENTION

Patients eligible for this Expanded Access Program will be identified by their treating providers and registered with American Red Cross or other blood source by uscovidplasma.org. Since this involves the administration of COVID-19 convalescent plasma to patients in acute care facilities, participant retention is not anticipated to be an issue.
6 STUDY INTERVENTION

6.1 STUDY INTERVENTION(S) ADMINISTRATION

This expanded program will make available compatible COVID-19 convalescent plasma collected by blood establishments in accordance with the AABB Circular of Information and FDA’s regulations and the additional considerations for convalescent plasma on FDA’s webpage (https://www.fda.gov/vaccines-blood-biologics/investigational-new-drug-ind-or-device-exemption-ide-process-cber/investigational-covid-19-convalescent-plasma-emergency-inds).5

6.1.1 STUDY INTERVENTION DESCRIPTION

Compatible COVID-19 convalescent plasma will be administered according to standard hospital procedures.

6.1.2 DOSING AND ADMINISTRATION

For practical purposes in the current outbreak, one – two units of COVID-19 convalescent plasma will be administered. This will be provided by a registered or licensed blood collector and will be collected preferably by apheresis (total volume of plasma to be administered will be approximately 200 mL or more), or if necessary, by conventional methods (volume of plasma to administer approximately 200-250 mL per unit). Individual institutional guidelines for the administration of plasma should be followed, including the use of any premedications, such as acetaminophen and diphenhydramine.

If a subsequent unit of convalescent plasma is transfused, the treating physician will begin the transfusion at a time that is clinically compatible with the patient’s underlying condition.

6.2 PREPARATION/HANDLING/STORAGE/ACCOUNTABILITY

6.2.1 ACQUISITION AND ACCOUNTABILITY

Convalescent plasma units may be obtained from a registered or licensed blood collector following registration of the patient.

6.2.2 FORMULATION, APPEARANCE, PACKAGING, AND LABELING

COVID-19 convalescent plasma will be supplied as an investigational blood product for the treatment of COVID-19. A label or tie tag on the bag should indicate the presence of COVID-19 antibodies, if testing is available.

The container label of COVID-19 convalescent plasma units must include the following statement, “Caution: New Drug—Limited by Federal (or United States) law to investigational use.” (21 CFR 312.6(a)).

In addition, the requirements in 21 CFR 606.121 for the container label apply, including the requirement to include a reference to the circular of information.
6.2.3 PRODUCT STORAGE AND STABILITY
Please see the AABB Circular of Information for product storage and stability.

6.2.4 PREPARATION
Please follow local institutional guidelines for conventional plasma administration for COVID-19 plasma preparation prior to administration, including compatibility checks and thawing.

6.3 CONCOMITANT THERAPY
Premedications may be administered prior to plasma administration according to individual acute care facility protocols.
7 STUDY INTERVENTION DISCONTINUATION AND PARTICIPANT DISCONTINUATION/WITHDRAWAL

7.1 DISCONTINUATION OF STUDY INTERVENTION
This study involves the administration of COVID-19 convalescent plasma. Patients are free to withdraw consent from participation at any time.

7.2 PARTICIPANT DISCONTINUATION/WITHDRAWAL FROM THE STUDY
Patients are free to withdraw consent from participation in further data collection at any time during the study.
Study team encouragement of withdrawal from the EAP as a strategy to avoid completion of follow-up data requirements is not allowed.

7.3 LOST TO FOLLOW-UP
Since this protocol involves only the acute care of individuals with COVID-19, it is not anticipated that individuals will be lost to follow-up.
8 STUDY ASSESSMENTS AND PROCEDURES

8.1 EFFICACY ASSESSMENTS

Patient demographic information will be obtained to include age and sex.

Assessments for potential efficacy are exploratory as part of this expanded access program but may include web-based collection of the following information:

1. Acute care facility length of stay
2. Number of days in an intensive care unit
3. Number of days on mechanical ventilation
4. Survival until discharge from an acute care facility

An exploratory analysis may be conducted correlating the level of neutralizing antibody titers with clinical outcomes observed.

8.2 SAFETY AND OTHER ASSESSMENTS

Reporting is required for serious adverse events (SAEs); and we will ask the treating physician when reporting the event to determine if the event is potentially related to the administration of the COVID-19 convalescent plasma.

8.3 ADVERSE EVENTS AND SERIOUS ADVERSE EVENTS

Serious adverse events should be reported, by the treating physician to the sponsor/principal investigator using the forms provided on the website (www.uscovidplasma.org).

The sponsor/principal investigator is responsible for filing reports to the FDA and IRB as required.

8.4 UNANTICIPATED PROBLEMS

Any unanticipated issues should be reported to the principal investigator and to the IND Sponsor, Michael Joyner by sending an email to uscovidplasmaevents@mayo.edu.
9 STATISTICAL CONSIDERATIONS

9.1 STATISTICAL HYPOTHESES
This is an expanded access program and any statistical analyses for safety or efficacy will be exploratory.

9.2 SAMPLE SIZE DETERMINATION
This is an expanded access protocol that is intended to supply COVID-19 convalescent plasma to individuals with severe or life-threatening disease or at high risk thereof. It is anticipated that up to several thousand COVID-19 patients might be enrolled, though this number is difficult to estimate, given the evolving nature of the current pandemic.

9.3 POPULATIONS FOR ANALYSES
Serious adverse event information will be collected on all consented and enrolled patients for whom convalescent plasma is ordered.

Exploratory analyses will be performed on data obtained from individuals providing informed consent.

9.4 STATISTICAL ANALYSES
Exploratory statistical analyses will be performed as part of this expanded access program.

9.5 PUBLICATION PLAN
The sponsor of this Expanded Access Program will limit the publication of any partial data collected by any participating treating physician or site without prior written authorization. With rare exceptions, such authorization will likely come after the sponsor has closed program enrollment, completed the data analysis and evaluated the final data set for the primary safety outcomes.
10 SUPPORTING DOCUMENTATION AND OPERATIONAL CONSIDERATIONS

10.1 REGULATORY, ETHICAL, AND STUDY OVERSIGHT CONSIDERATIONS

Plasma represents a licensed blood product. However, the use of plasma for the treatment of COVID-19 is investigational.

10.1.1 INFORMED CONSENT PROCESS

Since the use of COVID-19 plasma is investigational at this time, a discussion of potential risks and benefits to its administration, as well as alternative options, should take place with patients or their healthcare proxies. This should be documented in the medical record.

10.1.1.1 CONSENT/ASSENT AND OTHER INFORMATIONAL DOCUMENTS PROVIDED TO PARTICIPANTS

The IRB approved informed consent form is available on the website www.uscovidplasma.org. The language has been deliberately streamlined for use in the setting of Expanded Access in the current COVID-19 pandemic.

10.1.1.2 CONSENT PROCEEDURES AND DOCUMENTATION

Consent must be obtained from the patient or the patient's health care proxy prior to treatment.

Expanded access to an investigational drug for treatment use, including emergency use, requires informed consent as described in 21 CFR part 50. Informed consent may be deemed infeasible if, in accordance with 21 CFR 50.23, the investigator and another physician who is not otherwise participating in the protocol certify in writing all of the following:

1. The patient is confronted by a life-threatening situation necessitating use of convalescent plasma

2. Informed consent cannot be obtained from the patient because of an inability to communicate with or obtain legally effective consent

3. Time is not sufficient to obtain consent from the patient’s LAR

4. There is no available alternative method of approved or generally recognized therapy that provides an equal or greater likelihood of saving the life of the patient.

If immediate use of the test article is, in the investigator’s opinion, required to preserve the life of the subject, and time is not sufficient to obtain the independent determination required above, the determinations of the investigator shall be made and, within 5 working days after the use of the article, be reviewed and evaluated in writing by a physician who is not participating in the clinical investigation.
The investigator upon documentation of the use of emergency consent notifies the Mayo Clinic IRB via
the web based patient entry portal. The study cannot proceed with an order for convalescent plasma
until the documentation is complete. The IRB Senior Chair and medical director receives a daily update
of study enrollment and key metrics. We will make sure this measure is also included in the daily report.

The computer system will generate a weekly report for the IRB office as a backup of the notification so
that the IRB has the original and a backup notification. These will be submitted to the IRB office as
notation items.

10.2 IRB RELIANCE

IRB Reliance

Your request to participate in the EAP, use of the product and the consent form indicates your
willingness and that of your institution/hospital/practice/legal business entity to rely upon the Mayo
Clinic IRB and that you will follow all federal and state regulations regarding use and administration of
the investigational product and that you will conduct the EAP in accordance with the principles set forth
in the Belmont Report.

10.3 SAFETY OVERSIGHT

Safety Oversight

The Mayo Clinic IRB, a DSMB and the US FDA will work collaboratively to follow SAE reporting
and monitor the conduct of the EAP.

The DSMB will be composed of experienced physicians and scientists who understand the risks
of administered products and have sufficient research and trial experience to provide an
independent recommendation to the PI, the IRB and the FDA. The FDA will hold the ultimate
decision-making power to terminate the study evidence of early benefit or harm. The DSMB will
generate regular reports to the IRB and FDA., The DSMB Chair, the regulatory sponsor, and
additional team members will communicate with the appropriate FDA officials for review and
guidance on study conduct. IND Safety Reports will be submitted to the FDA as required under
the IND.
DSMB Membership
The DSMB membership will include:

Allan S. Jaffe, MD - Chair
Professor of Medicine and Laboratory Medicine
Consultant in the Division of Cardiac Critical Care and Ischemic Heart Disease
Mayo Clinic, Rochester, MN

David O. Warner, MD - Secretary
Professor of Anesthesiology
Mayo Clinic, Rochester, MN

William Morice, MD
Professor of Laboratory Medicine
Chair, Department of Laboratory Medicine and Pathology
Mayo Clinic, Rochester, MN

Paula Santrach, MD
Associate Professor of Laboratory Medicine and Pathology
Consultant in Transfusion Medicine
Mayo Clinic, Rochester, MN

Robert L. Frye, MD
Professor of Medicine, Mayo Clinic and Past Chair, Department of Medicine
Mayo Clinic, Rochester, MN

Lawrence J. Appel, MD, MPH. David Molina, M.D., M.P.H. Professor of Medicine and
International Health, and Nursing
Director, Welch Center for Prevention, Epidemiology, and Clinical Research
Johns Hopkins Medical Institution

Rickey E. Carter Ph.D.
Professor of Biostatistics
Mayo Clinic, Jacksonville Fl.
